

# 347-STAB.ILL

## Lighting stabiliser

In motorhomes and campervans based on the Ducato 8 series platform, screen instability may occur with all aftermarket radio units, causing the display to switch continuously between day and night modes.

The problem is particularly noticeable when using navigation systems with CarPlay or Android Auto. The day and night displays alternate continuously. This is because the connected radio units do not recognise the lighting signal generated by the vehicle's control units.

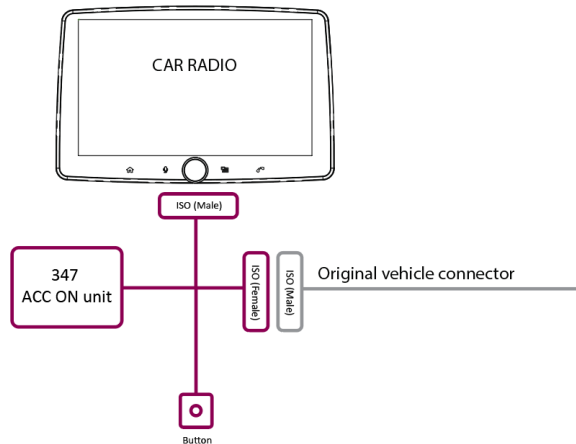

To resolve this issue, we have developed a voltage stabiliser that consolidates the signal generated by the vehicle, enabling the connected radio units to correctly recognise the lighting signal.

The 347-STAB.ILL stabiliser, equipped with ISO/ISO Plug & Play wiring, is fitted between the vehicle's original connector and the aftermarket radio connector and is compatible with all cars fitted with a connector.

### Technical specifications

- ISO/ISO Plug & Play wiring
- Voltage stabiliser
- Compatible with all vehicles and aftermarket radios
